As I said, it's a free registration and download and test environment so, be careful. This is a free registration and download and test environment so, be careful. Comparative analysis of biological activities of CD1d-expressing dendritic cells from Th17 and Th1 clones. Mixed lymphocyte reactions (MLR) between an IgE+/CD1d-derived clone (DU486), displaying a Th1 pattern of cytokines and a second clone, displaying a Th17 profile (DU187), have been compared. The latter is also positive for IgG (DU187-IgG), while the former expresses CD23 (DU486-CD23). As revealed by CD1d expression and mRNA levels of IL-2, IL-10, IL-12, IL-17A, TGF-beta1, IFN-gamma, T-bet, GATA-3 and RORc, the two clones are distinct and differ in the cytokine pattern and Th-lineage differentiation. Although the CD23 molecule was absent in DU486 and its CD23+ counterpart DU187, the expression of CD11c and HLA-DR was equivalent in the two clones. The proliferation of T cells to DU486-CD23 was not observed, while DU187-CD23 induced strong proliferation of the non-Th2 clone DU486-CD23. This latter event was associated with IL-4 and IL-13 secretion. Interestingly, DU486-CD23 stimulated only DU486-IL-4 and induced proliferation of DU486-IL-2/IL-13. By contrast, DU187-CD23 induced strong proliferation of DU187-IL-4 and induced IL-2/IL-13 production by DU187-IL-2. Altogether, our results show that CD1d molecules are not necessarily related to T-cell lineage differentiation. The present invention relates to a liquid crystal display device, and more particularly, to a back light system that can be used in a liquid crystal display device and a light diffusion device that can be used in the back light system. In liquid crystal display devices, a back light has been used as a light source for illuminating a liquid crystal panel. Recently, as back lights for liquid crystal display devices have become larger and larger, a light diffusion plate has also been used for the back light in order to prevent shadows from being produced on the liquid crystal panel.
